Framework RME usage flow

Each stage closes one of the three gaps left open in AI governance practice: the link between risk and mitigation, the measure of effectiveness and cost, and observation after deployment.

GAP ADDRESSED

- **Gap 1** no link between risk and mitigation
- **Gap 2** effectiveness and cost not measured
- **Gap 3** no post-deployment observation
- Operation: where gap 3 shows up
- Cross-cutting output of the framework

1 · Registering the portfolio

The AI system, with its EU AI Act risk tier, and the risks identified, classified into MIT AI Risk Repository subdomains.

C1 · C4 · RF06 · RF10

2 · Link

A catalogue mitigation is applied to the risk, under an owner, with a phase and an estimated cost. The risk and mitigation pair is unique.

C1 · C2 · RF01 · RF02 · RF07

3 · Evidence and verification

Evidence proves the implementation and an owner signs the verification: declared → verified, with a review date set by the system tier.

C1 · RF03 · RF07

maintain or adjust: the link returns to the cycle

4 · Operation

The system in production is monitored: adverse events and system changes are recorded, and the review clock runs.

C3 · RF04

5 · Reassessment

A trigger takes the link back to declared; the reassessment closes it with an outcome: maintain, adjust, replace or close.

C3 · RF05

Traceability report

Per system, as JSON and CSV: risk → mitigation → owner → evidence → status → reassessment, carrying the protocol version.

C4 · RF08

Audit trail

An append-only history of every progress and verification change, with its origin and, when manual, its owner.

RF09

Monitoring dashboard

Verification and reassessment pending by origin, upcoming reviews, recent events and risks not yet mapped.

C4

The cycle does not end: a link counts as verified **only while nothing changes**. The reassessment returns it to the cycle or closes it with the decision on record.
